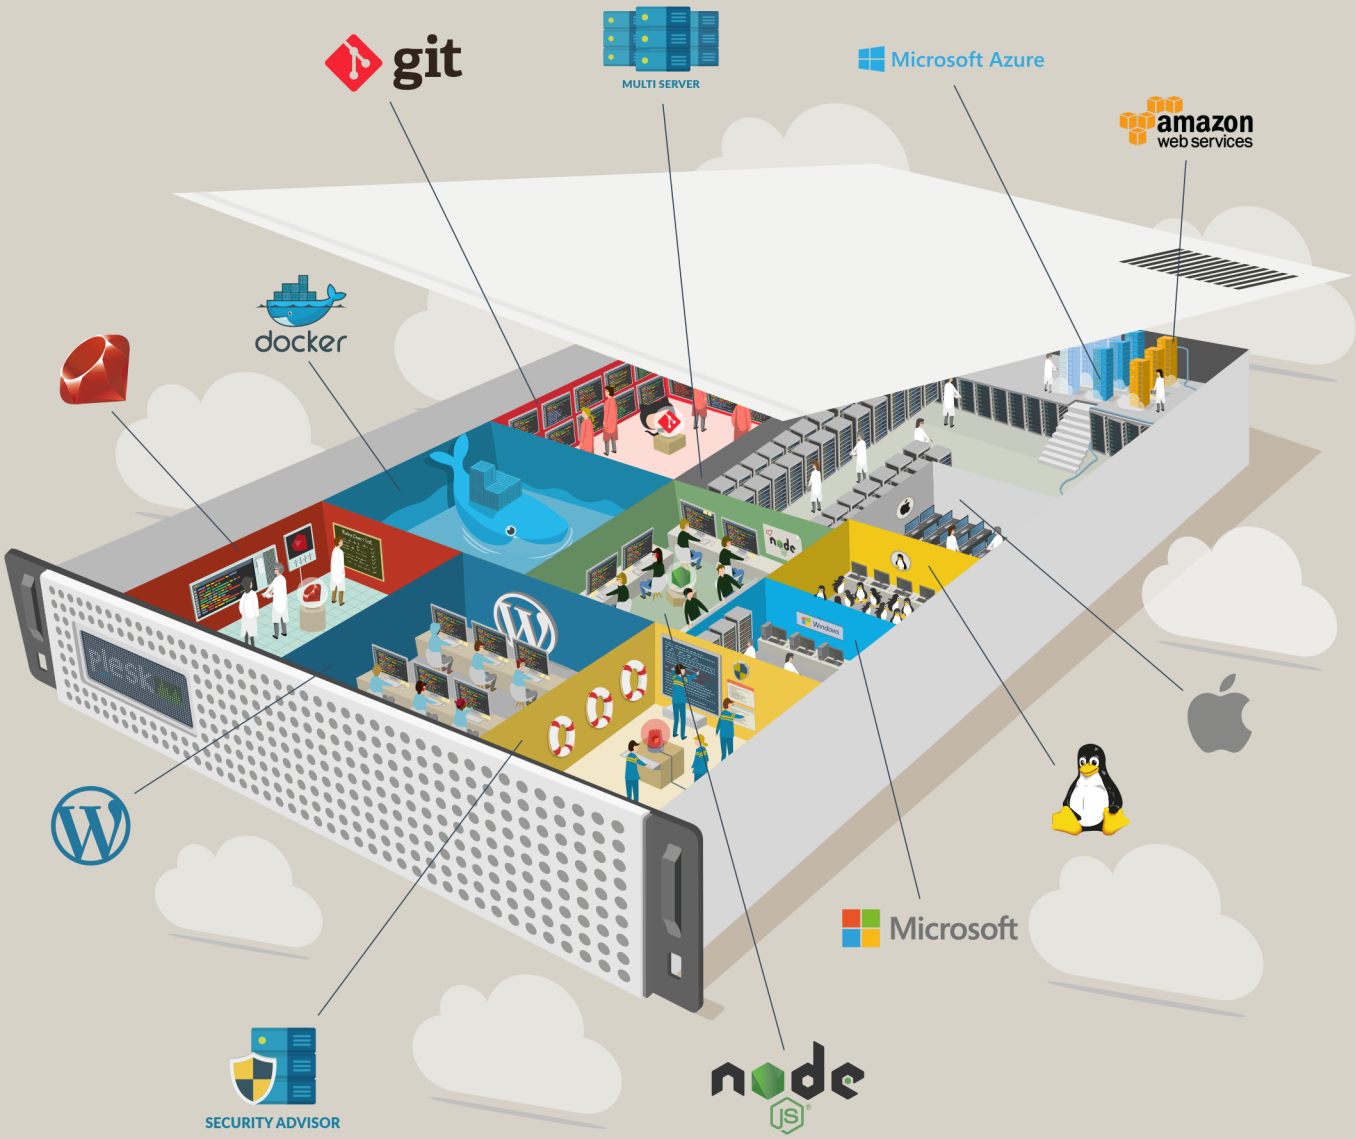
plesk

<!--the power. controlled.-->



Fed up with **managing infrastructure** and security instead of **focusing on coding**?

THE ONLY TOOL YOU'LL EVER NEED TO **DESIGN** OR **DEVELOP** CLOUD-BASED WEB APPS.

Build

Providing a ready-to-code environment in an intuitive interface, Plesk lets you do what you're best at: creating cloud-scaled web applications and websites for SMB's (small and medium businesses).

Secure

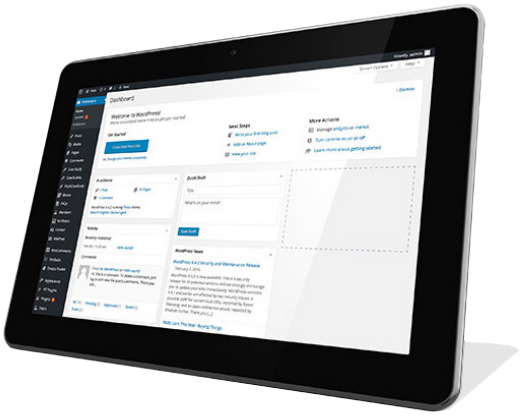
Web industry research shows 9 out of 10 web app developers decide on securing an application when it's too late. Plesk fully secures your applications and websites automatically.

Run

Focus your skills not on infrastructure management but on coding. Save crucial time by automating all server related tasks and components to run and scale your web applications and websites.

Shared Hosting reinvented

Plesk is the market leader in powering shared hosting platforms that scale from one to thousands of servers. Whether you run on Linux or Windows – we provide you a unified user experience and feature parity cross platform.



WordPress

WordPress Management

With WordPress Toolkit built into Plesk, the world's most popular CMS just became even smoother to use. Plesk lets web professionals efficiently mass-manage WordPress instances, themes and plug-ins while simplifying their back-end administrative requirements. This means full service infrastructure protection and automated security at the click of a button.

WebOps for Developers

Plesk provides you a ready-to-code environment. Optimize project timelines and focus your talents on developing web applications while we take care of deploying programming languages, frameworks, databases and security.

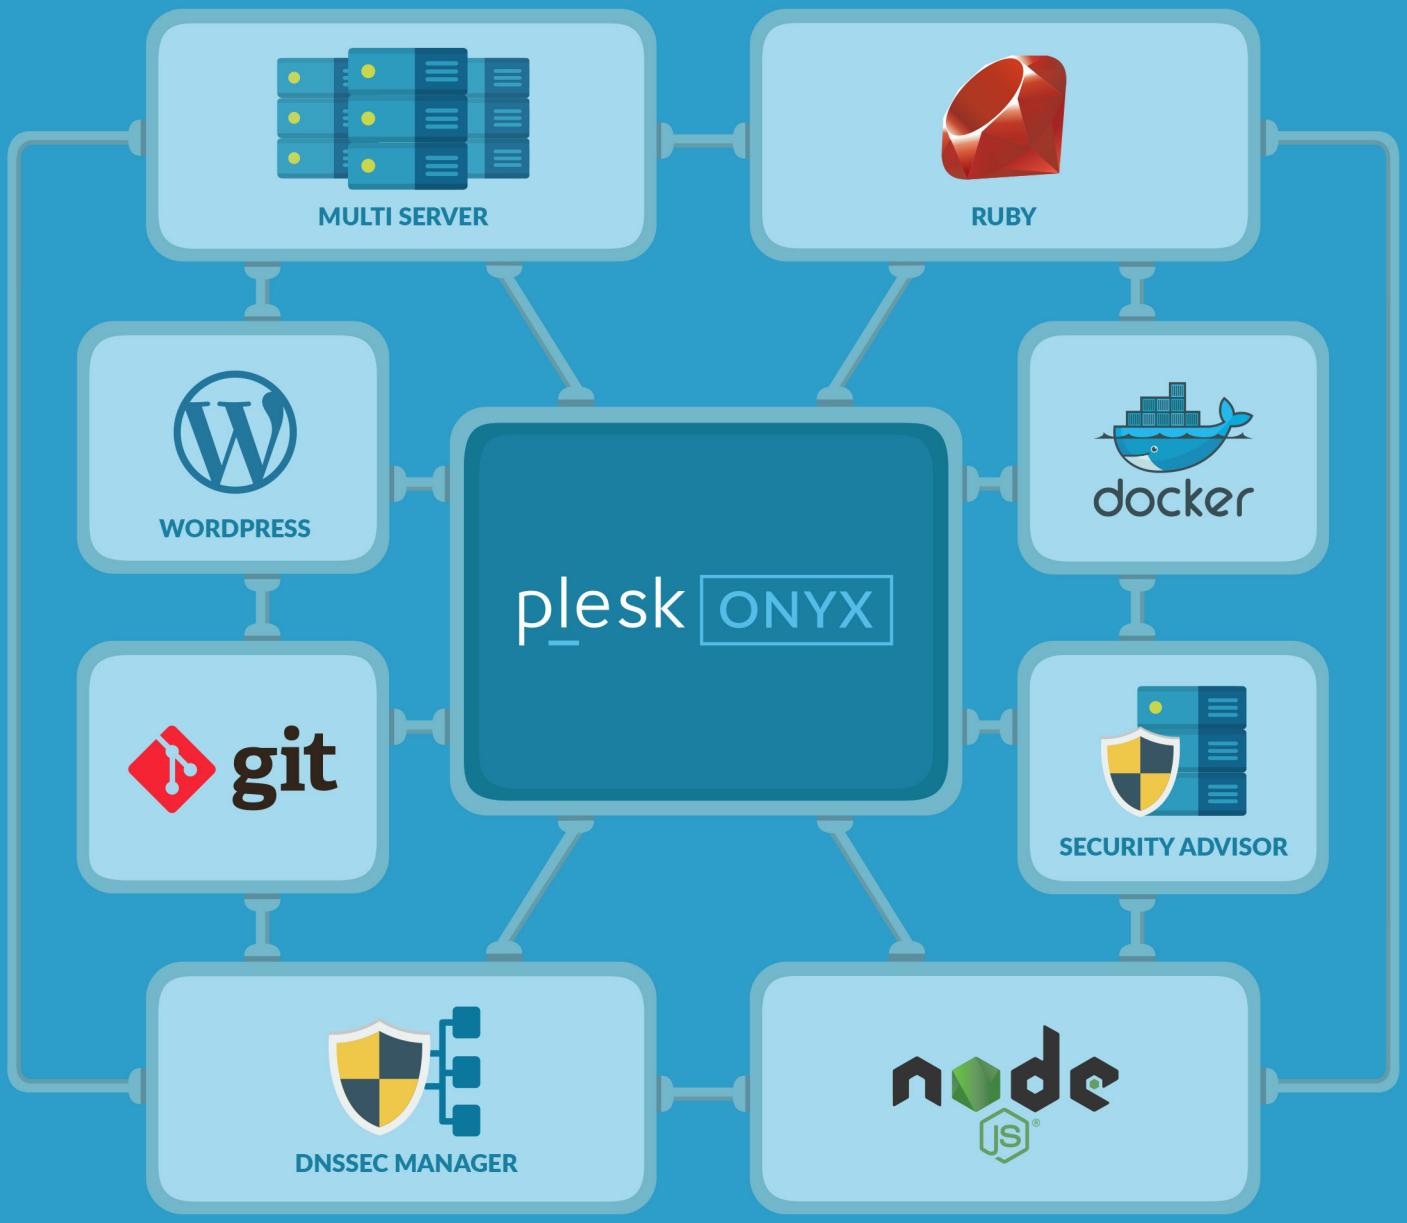
What is WebOps?

Web Operations (or WebOps) is defined as a domain of expertise within IT systems management that entails the deployment, operation, security, maintenance, tuning, and repair of web-based systems. It is considered a subset of the larger DevOps movement. In the past, these tasks required a number of specialists to ensure correct functioning of all the components throughout an application's lifetime. Today, the WebOps role is rapidly becoming a distinct specialty to support application developers.

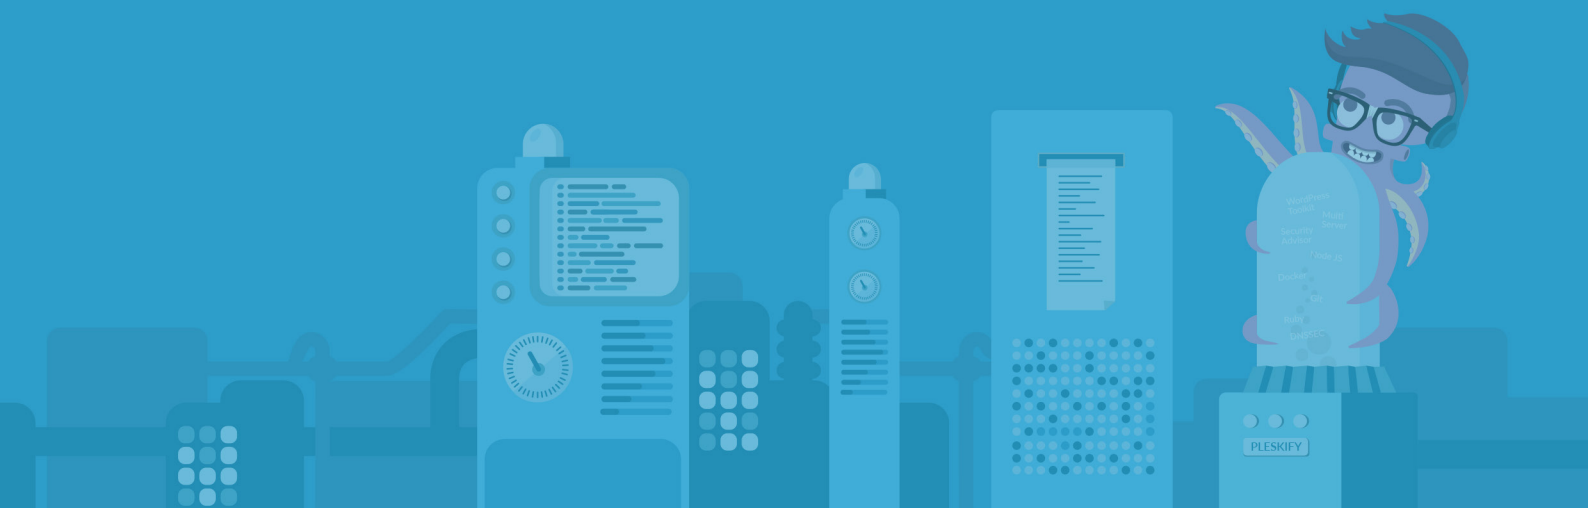
By automating all such tasks and procedures through the Plesk platform, any web professional, from less seasoned to highly accomplished, can have simple and direct access to the building blocks of development.

How does WebOps differentiate from shared hosting

- Shared Hosting is generic and focused on SysAdmin – WebOps focuses on developers.
- Shared Hosting is geared towards services (websites, email, etc.) – WebOps comprises application development workflows plus automation of infrastructure and security underneath.
- Shared Hosting is about installing services only – WebOps handles the whole life cycle from installation, operation, maintenance and security of services.
- Shared Hosting uses server resources in a siloed mode – WebOps provides an integrated environment of services that is entirely friction free to operate.



Find out more at www.plesk.com



Plesk takes traditional shared hosting to a whole new level.

We provide the platform to build, secure and run your web applications, websites and even hosting business (not to mention market leading UX).

- WordPress Toolkit
- State of the Art Control Panel & Dashboard
