

One-click SSL Installation for Plesk Users

Symantec and Plesk work together to allow fast and simple SSL deployment from within the Plesk environment

Symantec's integration within the Plesk environment aims to provide a secure end user experience through quick and easy, one-click implementation of SSL Certificates while using Plesk to meet your hosting needs.

Plesk is running on more than 377,000 servers, automating 11M+ websites and 19M mail boxes

Plesk helps site owners to manage their websites, email account access and an array of other hosting solutions, and the partnership with Symantec makes securing domain names streamlined and simple. Tightly integrated with the regular workflows of Plesk, you can enable https support on your domain by one-click installation of a Complimentary SSL Certificate from Symantec within the control panel of Plesk.

As the bar for basic security on websites continues to rise, Symantec's relationship with Plesk allows Encryption Everywhere™ (EE) partners to automatically procure Complimentary SSL Certificates to get sites https ready without any manual intervention. Time consuming manual steps such as CSR generation, domain authentication and certificate installation are all automated with the Plesk Symantec SSL integration. With a simple click of the mouse, SSL encryption is able to be added to a business' website and gain compliance with the most popular browsers in use today, and provide a more secure environment for the end user, while you can focus more time on delivering value to your customers.

Customer Integration

For the Plesk user, a new option will display in their control panel to enable https on their site(s). No action is needed on the user's end to integrate, but the Symantec terms and conditions will need to be accepted. This makes setup and integration seamless for the end user, as functionality is automatically set up, so there are no resources or development required to enable their site for https. Any support and troubleshooting needs are provided by Plesk directly.

Partners also benefit from the ability to very easily upgrade customers from the Complimentary SSL Certificates to additional features available within the EE Program. For businesses with multiple websites, the Security Advisor Plesk Extension allows for Basic SSL installation on multiple domains, all within the same control panel.
